(54) Title: AUTOMATED SELF-SERVICE PACKAGE SHIPPING MACHINE

(57) Abstract

A self-service apparatus (100) capable of automatically handling envelopes and packages through various stages of processing, including touch screen (110) to handle various inputs from the customer, digitized voice (112) to prompt the customer and instruct him in the processing, electronic weighing (138), electronic printing (142) of the ZIP + 4 barcode, electronic printing of the shipping label (140), electronic printing of the receipt (128), electronic printing (140) of the manifest documentation for both the letters and packages, and maintaining of the manifest documentation for both the letters and packages. Mailing charges are deducted from a prepaid magnetic card through the use of a magnetic card reader (122). Maintaining postage and shipping rates, ZIP+4 CD-ROM directory in order to locate the ZIP+4 information. A dual floppy disk system (124, 126) to allow the mailer to send electronic mail. A built-in facsimile apparatus (120) to allow the customer to send "FAX" information through the telephone line.

10 **AUTOMATED SELF-SERVICE PACKAGE SHIPPING MACHINE**

15 The invention relates to automated self-service systems for receiving and initially processing letters and other packages for subsequent transportation by the U.S. Postal Service and/or private package shipment companies.

20

 The Appendix sets forth copyrighted subject matter. No objection is made to reproduction of the Appendix solely in connection with reproducing any patent that may issue from this application, but all other rights under
25 copyright law are reserved.

 An automated self-service machine in accordance with the invention advantageously combines features of mailroom automation systems with features of bank
30 automated teller machines. The machine may be located in post offices, convenience stores, and the like.

 A notable aspect of the self-service machine is its user interaction. In operation, the machine conducts a
35 dialog with a user/customer, via a touch screen and a digitized voice output (or other input/output devices), to obtain information about the customer's intended shipment address, class of service, and the like. The customer may specify, e.g., first-class mail, registered

or certified mail, and the like. The customer may specify a language (e.g., English, Spanish) in which he or she wishes to communicate. Certain dialog segments are color-enhanced, e.g., a green representation of a certified mail "green card" receipt is displayed on a color monitor to aid the customer in providing information about a certified mail letter.

The machine measures the weight and other dimensions of the customer's package; the measurement is performed automatically for packages whose dimensions fall within specified limits. Using these measurements and the customer-provided information, the machine computes the postage or other shipping charge. The shipping charge may include a fee charged by the owner of the convenience store or other machine location, e.g., to cover the overhead cost of having the machine on-site.

The machine obtains payment from the customer, notably through the use of a prepaid, low-cost charge card which may be sold in convenient denominations at the machine's location (e.g., at a convenience store). A magnetic card reader for handling such cards may be connected through a conventional interface directly to, e.g., a convenience store cash register. Alternatively, the customer may use a credit card to make payment.

The machine prints a routing/shipping label for the customer's package. If the package is a simple first-class letter, the label may comprise a postal bar code printed directly on the letter's envelope. The bar code may embody the nine-digit ZIP+4 code of the destination address, which may be looked up by the machine from a database in a CD-ROM disk. If the package is a letter to be sent by certified mail, the machine prompts the user to insert a U.S. Postal Service

certified mail "green card" blank form for printing. If the package is a box or large envelope, the machine may print a shipping or mailing label, including an appropriate routing/tracking bar code, on peel-off label stock; the customer may then apply the label to the package.

Prior to printing a shipping label or bar code, the machine may advantageously consult a directory (e.g., a ZIP+4 directory) to verify that the destination address specified by the customer is not obviously incorrect. Furthermore, the information obtained from the customer by the machine includes the customer's name, address, and telephone number, enabling the shipping company to contact the customer more readily if the customer's package cannot be delivered.

When the customer's transaction is complete, the labeled package is automatically received into a locked storage compartment in the machine. The storage compartment may be emptied at a convenient time, e.g., by a convenience store clerk, and its contents delivered to the U.S. Postal Service or other shipping company. A sensor detects when the storage compartment is full and alerts appropriate personnel.

A printer in the machine prints a customer receipt. The printer may be a thermal printer, and the receipt may be printed on aluminized stock, to reduce the chance of customer alteration of the receipt.

When a machine operator (e.g., a convenience store clerk) inputs an appropriate instruction at the "end of the day," a hard-copy manifest of packages received by the machine is generated.

The machine may be operated by a customer in an "Inquiry" mode. For example, a customer may use the machine simply to look up the nine-digit ZIP code for a particular street address. This feature may be provided
5 free of charge as a courtesy.

Like reference numerals are used to refer to the same components and parts in all of the following
10 Figures:

Figure 1 is a perspective view of an automated mailing apparatus in accordance with the present invention;

15 Figure 2 is a top view of the letter-handling system assembly of the apparatus of Figure 1;

Figure 3 is a top view of the apparatus of Figure 1;

- 1312 30-V, 60-V power supply
- 35 ZP1000 signal distribution board - Easthem
Associates, Houston

Some features of the machine 100 are particularly noteworthy. As shown in Figure 2, the ink jet printer is tilted downward when at rest (the normal position of the HP printer), and rotated up as needed to print upward.
5 This is done by using an electrical linear actuator 700 and rotation linkages as shown in the Figure.

Packages are weighed by using a 100 lb load cell (strain gauge bridge). When a package is accepted, the
10 package platform 138 is tilted by an electrical linear actuator 408 to tip the package into the storage compartment area ____.

The package window mechanism is secured in the up
15 position by a Ledex size 6ep solenoid. Once the solenoid is activated, the lock is released and the Superior stepping motor MH-LLR-PF-8020 begins to rotate. The motion is transferred into linear motion up and down by using a Kevlar timing belt. The THK bearing and the
20 idler pulley to home the window into its position. We are using optical sensor limit switches by Honeywell. The package window mechanism is mounted on the inner side of the package door.

25 The machine 100 of the illustrative embodiment is operated by computer software shown in detail in the Appendix, which comprises 265 pages each numbered in the lower right corner with serial numbers PI00001 through PI00265. As shown in the Appendix, a series of screen
30 displays is presented to a user/customer on the touch screen 110; the customer's responses on the touch screen 110 or other input device (e.g., a conventional computer keyboard) are used in controlling the machine's operations.

-13-

The software controlling the machine also includes a ZIP+4 database and lookup software. In the illustrative embodiment, the ZIP+4 database and control software distributed by the First Data Resource Company of
5 Memphis, Tennessee is used.

The interrelationship of the various parts of the machine 100 may be conveniently described through a discussion of the operation of the machine.
10

A user/customer starts the machine by inserting a prepaid charge card into the receiving slot of a magnetic card reader 122, which activates the apparatus. The charge card may be a conventional stiff-paper card with a
15 magnetic stripe on one side, similar to those used by the Bay Area Rapid Transit system (BART) in the San Francisco area.

The customer then touches the touch screen 110,
20 which may be a conventional touch screen activated by an infrared array or sonic waves or resistance screen. Touching the screen activates a voice system which instructs the operator through a loudspeaker 112 what the next step will be. By following the voice instruction
25 and the printed instructions on the screen 110, the customer is led step by step through the processing of a package or a letter.

As shown by the illustrative screen displays in the
30 Appendix and by the flow diagrams in Figures _, once the customer has selected a First Class letter he follows the instructions. The customer then puts the letter into the letter acceptance slot 104. The letter handling system 200 moves the letter automatically through weighing,
35 measuring, scanning and printing and finally depositing

the letter into the removable letter tray where all processed letters are collected.

5 Once a letter is processed, a receipt is printed for any letter that is certified, registered and insured. The cost of mailing is deducted from the prepaid magnetic card and the card is returned to the customer.

10 The customer is able to request an electronic mail operation (e.g., using a conventional electronic mail service such as MCI Mail) using one of the two types of floppy-disk drives 124, 126 by inserting a floppy disk into the drive and following the voice/touch screen 110 instruction. The customer is thereby able to transmit
15 his files to another computer. The cost of the electronic mailing is deducted from the prepaid magnetic card and the card is returned to the customer.

20 The customer is able to request to use the built-in FAX scanner 120 in order to transmit documents across telephone lines to another location. The customer follows the voice and screen instruction and then inserts his documents one by one into the FAX scanner 120. The machine 100 automatically transmits the documents to the
25 other location. The cost of mailing is deducted from the prepaid magnetic card and the card is returned to the customer.

30 The customer may select after inserting his prepaid magnetic card to process packages by touching the screen 110 and following the voice instructions. The package window door 106 opens, the customer puts the package inside the window on the package/scale/tilt assembly 400. The scale weighs the package; this weight is transmitted
35 to the computer which calculates the charges according to the destination zipcode. Once all the information that

relates to the shipper and destination is entered by the customer using the touch screen 110, a shipping label is printed using a package label printer 142. The customer pastes the label to the package and touches the screen on the appropriate box as shown by the illustrative screen displays in the Appendix. Once the customer has finished the processing, the package window door 108 is automatically closed. A receipt is produced by the receipt printer 128. The cost of shipping the package is deducted from the prepaid magnetic card and the card is returned to the customer.

To detect customer attempts to cheat (e.g., by submitting a light package for weighing but actually depositing a heavier package for shipping), the package is reweighed just prior to acceptance. If more than a +1% variation is detected, an error message is generated and the package is not accepted.

To reduce the chance of a too-heavy weight measurement (e.g., because the customer inadvertently has his finger on the scale), the scale detects weight variations of 0.01 oz. The weight is not measured for shipping-charge computation purposes until the weight stabilizes.

The tare (zero weight) of the scale is monitored to verify that nothing is left on the scale and that the scale is not damaged.

It will be appreciated that the foregoing embodiment is described for purposes of illustration and not as a limitation on the exclusive rights of the inventors. Various changes may be made (e.g., through the substitution of components; implementation of software functions in hardware and vice versa; and the like)

without departing from the spirit of the invention. The embodiments which are claimed as the exclusive property of the inventors are as described in the claims below.

CLAIMS:

1. An automated self-service package shipping machine comprising:

5

(a) means for receiving a package;

(b) screen-display means for displaying user instructions;

10

(c) user input means for transmitting user preferences;

(d) means for printing a destination label;

15

(e) means for printing a customer receipt; and

(f) locking means for securing the package.

INTERNATIONAL SEARCH REPORT

International Application No. PCT/US92/02510

I. CLASSIFICATION OF SUBJECT MATTER (if several classification symbols apply, indicate all) *		
A. International Patent Classification (IPC) or to both National Classification and IPC		
IPC(5): G07B 17/00		
US CL: 364/478		
II. FIELDS SEARCHED		
Minimum Documentation Searched ⁷		
Classification System	Classification Symbols	
U.S.	364/478, 464.02; 235/381	
Documentation Searched other than Minimum Documentation to the extent that such Documents are included in the Fields Searched ⁸		
III. DOCUMENTS CONSIDERED TO BE RELEVANT ¹		
Category ²	Citation of Document, ¹¹ with indication, where appropriate, of the relevant passages ¹²	Relevant to Claim No. ¹³
Y	US, A, 4,024,380 (GUNN) 17 May 1977, See figure 6c, and columns 1-3.	1
Y	US, A, 4,598,810 (SHORE ET AL.) 08 July 1986, See column 1 objects of the invention.	1
Y	US, A, 4,803,348 (LOHREY ET AL.) 07 February 1989, See claim 26.	1
X	US, A, 4,825,053 (CAILLE) 25 April 1989, See column 4, lines 18-54.	1
X	US, A, 4,900,905 (PUSIC) 13 February 1990, See claims 1, 7, 11 and figure 2.	1
Y	US, A, 4,940,887 (SHENG-JUNG) 10 July 1990, See summary and column 5, lines 16-26.	1
X,P	US, A, 5,025,386 (PUSIC) 18 June 1991, See abstract and claims 1, 7, 12, 15).	1
Y,P	US, A, 5,065,000 (PUSIC) 12 November 1991, See invention summary.	1
<p>* Special categories of cited documents: ¹⁰</p> <p>"A" document defining the general state of the art which is not considered to be of particular relevance</p> <p>"E" earlier document but published on or after the international filing date</p> <p>"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)</p> <p>"O" document referring to an oral disclosure, use, exhibition or other means</p> <p>"P" document published prior to the international filing date but later than the priority date claimed</p> <p>"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention</p> <p>"X" document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step</p> <p>"Y" document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.</p> <p>"G" document member of the same patent family</p>		
IV. CERTIFICATION		
Date of the Act of Certification of the International Search	Date of Mailing of this International Search Report	
22 JUNE 1992	28 JUL 1992	
International Searching Authority	Signature of Authorized Officer
